

Electric Harvia Heaters

Best Practices

Here are some great tips to share with your installer / electrician:

The heater should be installed as low as allowed by the manual. This will give the best distribution of heat in the sauna.

*** Note required safety clearances for your heater ***
These must be followed.

The Contactor Box / Main Module is NOT weatherproof and cannot be installed in the sauna.. If outdoors we recommend installing it in a [weatherproof ventilated box](#). Size: **17.7"x13.7"x7.9"**

High Voltage Wire is to be supplied by the electrician. Only low voltage wiring is included with the controller.

The XENIO Sauna Controller is usually installed at the user's eye level next to the door in a **dry** location or [weatherproof box](#). Size: **8.7"x6.7"x4.3"**. The controller cannot be installed in the sauna.

If you received the new Harvia FENIX controller, this can be installed in the hot room of the sauna following the [manufacturer's instructions](#). If installing outside of the sauna and your controller will be exposed to weather, a weatherproof box is required.

It is recommended that lights be wired to a separate 120v circuit to provide uninterrupted power. If a separate circuit is not available, the lights can be wired to the power module as stated in the instructions.

If your lighting kit has a separate control module and remote, the lights must first be activated at the heater controller (lightbulb icon) to provide power to your lighting kit. It can then be controlled by your lighting remote.

Do not bypass the door sensor (if included), as this will void the heater's warranty.

Please find additional information on your specific heater below:
